

A new synonymy in Japanese *Heterlimnius* HINTON, 1935 (Coleoptera: Elmidae)

Y. KAMITE

Abstract

Heterlimnius rugulosus (NOMURA, 1958) (Coleoptera: Elmidae) is synonymized with *H. nitidus* (NOMURA, 1958). This species is redescribed, and a morphological diagnosis of the larva is provided. Numerous locality data and a distribution map, based on material examined by the author, are provided.

Key words: Coleoptera, Elmidae, *Heterlimnius rugulosus*, *Heterlimnius nitidus*, adults, larvae, taxonomy, distribution, faunistics.

Introduction

KAMITE (2009, 2011, 2012, 2013, 2015, 2016) provided a global revision of the Holarctic elmid genera *Heterlimnius* HINTON, 1935 and *Optioservus* SANDERSON, 1953. Eventually, KOBAYASHI et al. (2021) synonymized *Optioservus* with *Heterlimnius*; in addition, the Japanese endemic *H. nitidus* (NOMURA, 1958) and *H. rugulosus* (NOMURA, 1958) were placed in the *H. quadrimalcatus* species group.

The genus *Heterlimnius* currently comprises 42 species (25 Palearctic, 17 Nearctic), which are divided into seven species groups. In the present paper, one of these species, *H. rugulosus*, is synonymized with *H. nitidus*.

Material and methods

This study is based on the examination of 1,667 adults and 79 larvae. The material examined is deposited in the following collections:

CHM	collection of Naoyuki Hikida, Mito, Japan
CKN	collection of Yuuki Kamite, Nagoya, Japan
CMS	collection of Hirofumi Moriya, Sagamihara, Japan
EMEC	Essig Museum of Entomology, Berkeley, California, USA
EUMJ	Ehime University Museum, Matsuyama, Japan
NMW	Naturhistorisches Museum Wien, Vienna, Austria
NSMT	National Museum of Nature and Science, Tsukuba, Japan

The methods, as well as the abbreviations used in the redescription are the same as in KAMITE (2013), but scanning electron micrographs (SEM) were taken with a HITACHI TM3030Plus, and the specimens were sputter coated with gold.

Heterlimnius nitidus (NOMURA, 1958)

TYPE MATERIAL: *Optioservus nitidus*: **Holotype** ♀, examined (NSMT): “Shiromizu-gawa, 16.5.1942, (K. S.)”. No paratypes have been designated in the original description.

Optioservus rugulosus: **Holotype** ♂, examined (NSMT): “Furuya [erroneously spelled as ‘Furuya’ in original description], Kyushu, 22.VIII.1953, T Shirozu”. According to the original description, there are 13 paratypes from various localities in the Saga, Fukuoka, and Nagano prefectures, deposited in the collection of S. Nomura; these paratypes have not been studied by the author of the present paper.

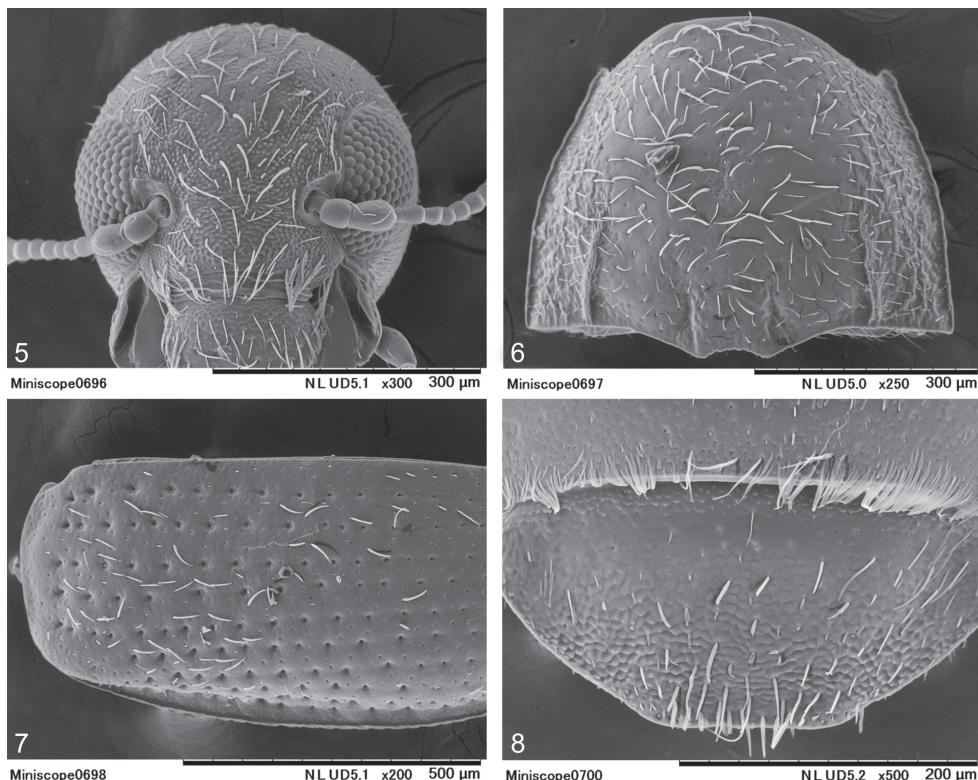

Figs. 1–4: Habitus of *Heterlimnius nitidus*; 1) adult, dorsal view; 2) same, lateral view; 3) larva, dorsal view; 4) same, lateral view.

REDESCRIPTION: Adult. TL/EW 1.76–2.12 (2.04). Dorsal surface black, but elytra dark brown to black, with yellowish patches at humeral and apical areas (Fig. 1). Humeral yellowish patches extending from about second elytral stria to lateral margin, comprising basal 1/3–1/5 of elytral length. Ventral surface, antennae, mouth parts and legs reddish brown to blackish brown, but antennomeres 1–8 and tarsi paler.

Head almost flat on dorsal surface, densely granulate and pubescent (Fig. 5). Eyes rather small; distance between eyes about 1.35 times as long as the maximum diameter of an eye. Antennae with dense setae at antero-lateral corners of antennomeres 9 and 10 and apical part of antennomere 11; approximate ratio of each antennomere: 2.1 : 1.9 : 1.6 : 1.0 : 1.0 : 1.1 : 1.0 : 1.5 : 1.5 : 3.0. Clypeus transverse, about 2.69 times as wide as long. Labrum transverse, about 1.88 times as wide as long.

Pronotum transverse (Fig. 6), slightly convex (Fig. 2); lateral areas moderately granulate; without median longitudinal impression; prescutellar pits present; antero-lateral corners

moderately produced anteriad. PW/PL 1.26–1.39 (1.33); sublateral carinae 0.29–0.34 ($n = 10$, 0.31) times as long as PL.

Figs. 5–8: *Heterlimnius nitidus*; 5) head; 6) pronotum; 7) left elytron; 8) abdominal ventrite 5.

Elytra elongate oval; moderately convex (Fig. 2); lateral margin weakly serrate; intervals not distinctly rugose, slightly convex; punctate striae shallow or vague; strial punctures moderately large and deep; basal part of 3rd interval wider than that of 4th (Fig. 7); EL/EW 1.23–1.56 (1.48); EL/PL 2.33–2.86 (2.63); EW/PW 1.29–1.40 (1.34).

Prosternal process narrowing posteriorly, rounded at apex. Anterior part of mesoventral groove relatively narrow. Abdominal ventrite 5 weakly granulate; apex evenly rounded or somewhat truncate, with long hairs (Fig. 8).

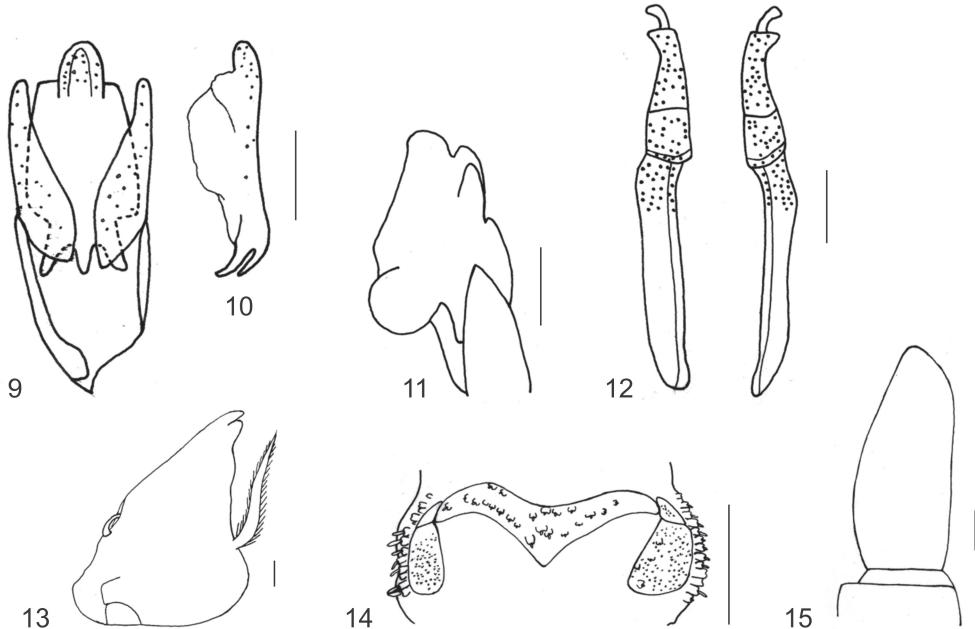

Aedeagus as in Figs. 9–11; phallobase smooth at lateral and ventral surface; penis about 1.29 times as long as phallobase; apical part rounded, slightly curved ventrad in lateral view (Fig. 10); parameres slender, about 0.79 times as long as penis; lateral view of endophallus as in Fig. 11.

Ovipositor as in Fig. 12; coxite about 5.48 times as long as stylus; valvifer about 9.90 times as long as stylus.

MEASUREMENTS ($n = 10$): TL 1.53–1.81 (1.68) mm; PL 0.44–0.50 (0.46) mm; PW 0.58–0.66 (0.62) mm; EL 1.07–1.31 (1.22) mm; EW 0.79–0.87 (0.83) mm.

Larva. Body (Figs. 3–4) cylindrical; TL/TW 7.07–7.22 (7.15). Color brown, head, pronotum and abdominal segment 9 dark brown. Head about 1.19 times as wide as long; setiferous tubercles in mesal part and along suture; each tubercle relatively large. Mandibles (Fig. 13)

subtriangular, 1.30 times as long as wide. Labrum about 1.93 times as wide as long. Pronotum slightly wider than long; PW/PL 1.38–1.53 (1.43), not humped in middle. Meso- and metathorax with five ventral sclerites; antero-lateral sclerites triangular, small (Fig. 14). Abdominal segments 1–8 distinctly humped, segment 9 not humped dorsally; abdominal segment 9 without lateral keel (Fig. 15).

Figs. 9–15: *Heterlimnius nitidus*; 9) aedeagus in dorsal view; 10) penis in lateral view; 11) endophallus in lateral view; 12) ovipositor; 13) mandible (larva); 14) mesothorax, ventral view (larva); 15) abdominal segment 9, lateral view (larva). Scales: 9–12, 14–15: 100 µm; 13: 10 µm.

MEASUREMENTS ($n = 3$): TL 4.10–4.22 (4.17) mm; HW 0.29–0.30 (0.30) mm; PL 0.38–0.39 (0.39) mm; PW 0.54–0.58 (0.55) mm; TW 0.58–0.59 (0.58) mm.

DISTRIBUTION (Fig. 16): Japan (Honshû, Oki Islands, Shikoku, Kyûshû).

BIOLOGICAL NOTES: *Heterlimnius nitidus* is the most common species of *Heterlimnius* in Japan. Specimens are usually found in middle courses of rivers, where they prefer sandy substrates.

COMMENTS: Both nominal species (*O. rugulosus* and *O. nitidus*) were described in the same publication, even on the same page. The distinguishing characters listed by NOMURA (1958) are all based on generally variable characters: e.g., frontoclypeal suture feeble/distinct, middle of disc of pronotum with/without very feeble small elongate-oval impression; elytral intervals feebly/distinctly rugulose (the elytral intervals of the holotype of *O. rugulosus* are somewhat opaque, which can be often observed in older specimens). Since I was unable to detect any significant external or aedeagal distinguishing characters, *O. rugulosus* is here officially synonymized with *O. nitidus*. SATÔ (1992) already proposed this synonymy in his unpublished PhD thesis.

Heterlimnius nitidus is here chosen as the senior synonym, because in the literature it has been used much more often than the name *H. rugulosus* (see above).

Fig. 16: Geographical distribution of *Heterlimnius nitidus* based on the material examined by the author.

DIFFERENTIAL DIAGNOSIS: In adult features, this species somewhat resembles *H. sakaii* (KAMITE, 2015) in general appearance, but is easily distinguishable from the latter by the following characteristics: body small; pronotum with prescutellar pits (Fig. 6); intervals of elytra less rugose (Fig. 7); apical part of penis rounded (Fig. 9); lateral view of endophallus as in Fig. 11.

The larva of this species somewhat resembles that of *H. hagai* (NOMURA, 1958) in general appearance, but is easily distinguishable from the latter by the following characteristics: body small; meso- and metathorax each with five ventral sclerites (Fig. 14); abdominal segment 9 without lateral keel (Fig. 15).

Acknowledgements

I wish to express my sincere gratitude to Dr. Masahiro Sakai (Tōon, Japan) and Dr. Hiroyuki Yoshitomi (EUMJ) for their continuous encouragement. I would also like to acknowledge the late Dr. Masataka Satō, the late Mr. Takeshi Ogata, as well as Dr. Masakazu Hayashi (Hoshizaki Institute for Wildlife Protection, Kapan) and Dr. Manfred A. Jäch (NMW) for providing specimens and many useful comments for this study. Thanks are also due to Dr. William D. Shepard (EMEC) for reading an earlier draft of the manuscript. I would like to acknowledge my indebtedness to the following persons for their help in various ways: Mr. Yoshifumi Akiyama, Mr. Kōji Arai, Mrs. Shiho Arai, Mr. Mamoru Chachin, Mr. Toshiaki Dejima, Mr. Hirofumi Fujimoto, Mr. Jun'ichi Fujiwara, Mr. Naoyuki Hikida, Mr. Yoshihiro Hori, Mr. Toshiya Ikeda, Mr. Noriaki Inahata, Mr. Yasuyuki Iwata, late Mr. Hisashi Kadokawa, Mr. Kyoichi Kinomura, Dr. Tadashi Kitano, Dr. Takashi Kurihara, Dr. Munetoshi Maruyama, Dr. Yūsuke Minoshima, Mr. Takeshi Miyake, Mr. Masato Mori, Mr. Hirofumi Moriya, Dr. Jun Nakajima, Dr. Shūhei

Nomura, Mr. Naofumi Ogawa, Mr. Ichirô Ôshio, Mr. Sang Woo Jung, Mr. Kôichi Satô, Mr. Takashi Shimada, Mr. Yoshiaki Tahira, Mr. Osamu Yamaji and Mr. Hiroaki Yokoi. Finally, my heartfelt thanks are extended to my wife, Nami Kamite, who has continuously supported my field work in Japan.
